TAGA Harmony TCD-30 reviewed by "wstereo.pl" (03-2025).

**The first thing I noticed while listening to the TAGA Harmony TCD-30 player was the precision of its sound. It was really impressive.**

*A cool, successful CD player. TAGA Harmony consistently develops its range of devices for using silver discs, this time directing its latest product to beginner lovers of good sound or to people who do not want to spend too much on a new CD player. TAGA Harmony TCD-30 offers competent sound and at its price practically devoid of major flaws. The above-average accuracy and precision of presentation deserves special attention, sounds are shown with great attention and clarity. The resolution is really good, which favors accuracy, but it does not cross the border of breaking music into atoms, fluidity is maintained. The stage can also be liked: it is spacious, airy and free, although slightly more focused on width than depth. Speed and verve - no comments, micro-dynamic is quite good. It is a bit worse with the rendering of the power of playing. The player has some limitations in showing colors, reverberations and saturation of sounds and their differentiation, but in this respect it does not stand out from other entry-level devices. Good functionality: digital output to external DAC and headphone output with volume regulation.*
